

APPLICATION TO MAKE THE GAS FILLING STATION

EASY USING CRM (DEVELOPER)

ABSTRACT

The Gas Station CRM project on the Salesforce platform is a comprehensive solution designed to modernize core business operations. This robust application successfully transitions the business from manual, paper-based processes to a streamlined digital system, leading to significant improvements in both data accuracy and operational efficiency.

The system's foundation is built on a custom data model that centralizes all essential information. Key objects, such as **Buyers**, meticulously track customer details and purchase history, while **Suppliers** manage all aspects of fuel and product providers. A **Fuel Inventory** object provides a real-time view of stock levels, and a detailed **Transactions** object logs every sale with critical information like fuel type, quantity, and price.

To ensure both data integrity and a secure user experience, a structured permission model was implemented. By utilizing **Profiles** and **Permission Sets**, the application grants access based on specific user roles. For instance, a **Manager** has comprehensive data access for strategic oversight, while a **Sales Person** is limited to daily transaction tasks, protecting the confidentiality of other business data.

Automation is a cornerstone of the project, with **Flows** and **Apex Triggers** replacing repetitive manual tasks with dynamic, automated processes. A key automation is the flow that automatically generates and emails a digital receipt to a buyer upon transaction completion. On the technical side, Apex Triggers are crucial for enforcing complex business logic, such as preventing transactions that would result in negative fuel stock.

All of this data is leveraged through a suite of **Reports and Dashboards** that offer invaluable insights. Managers can view real-time performance indicators like daily sales summaries and fuel usage trends. Ultimately, this project demonstrates how Salesforce can be a transformative platform, enabling a more efficient, accurate, and customer-focused management system. This initial implementation also lays a strong foundation for future growth, with the potential to integrate advanced features like a customer loyalty program and mobile access.

OBJECTIVE

A Customer Relationship Management (CRM) system for a gas filling station is a comprehensive solution designed to enhance business efficiency and improve the customer experience. Its core purpose is to consolidate all critical information and automate key processes, leading to better decision-making and increased profitability.

Key Objectives of the CRM System

- **Centralized Operations:** The system provides a single, unified platform for managing essential data, including customer profiles, fuel inventory, supplier information, and station details. This consolidation eliminates the need for disparate systems and reduces administrative overhead.
- **Enhanced Customer Service:** By maintaining accurate and detailed records of customer information, vehicle types, and transaction history, the CRM enables personalized service and helps in resolving inquiries quickly and efficiently.
- **Data Security and Access Control:** The CRM ensures data integrity and security through a role-based access control (RBAC) model. This means different user roles, such as **Manager**, **Executive**, and **Salesperson**, have specific, secure permissions, limiting access to sensitive information and preventing unauthorized actions.
- **Operational Efficiency:** The system minimizes manual tasks and human error by automating routine processes. This includes managing customer details, tracking fuel transactions, and processing payments, which frees up staff to focus on more strategic activities.
- **Scalability and Future Growth:** Designed with scalability in mind, the CRM can easily accommodate new features and functionalities. This includes the future integration of **analytics tools** and **dashboards** for detailed reporting, enabling data-driven insights into sales trends, customer behavior, and inventory management.

Project Implementation Steps:

- **Salesforce Platform:** A leading cloud-based CRM solution that centralizes customer data, automates business processes, and enhances data security. It serves as the foundation for building custom applications and managing customer relationships effectively.
- **Custom Objects:** These are user-defined data structures (database tables) within Salesforce, created to capture and manage information unique to specific

business. They allow for the creation of custom fields, relationships, and page layouts.

- **Tabs:** User interface components that provide quick navigation to custom or standard objects, web pages, or other Salesforce items, streamlining user workflows within a Lightning App.
- **Lightning App:** A collection of related components, including objects, tabs, and utilities, packaged to serve a specific business function. It provides a user-friendly interface for employees to access and switch between essential tools.
- **Page Layouts:** Tools used to organize fields and sections on a record page, ensuring a logical, structured, and user-friendly data entry experience.
- **Profiles and Permission Sets:**
 - **Profiles:** Define the foundational level of access for a user, controlling what objects, fields, and features they can view and modify.
 - **Permission Sets:** Grant additional, specific permissions to users without altering their profile, enabling a flexible, role-based security model.
- **Roles and Hierarchy:** These define record-level access based on a user's position within the organizational structure, ensuring that data visibility is controlled and aligned with reporting lines.
- **Users:** Individual accounts that allow people to log in and interact with the system, with access rights and responsibilities governed by their assigned profiles and permission sets.
- **Organization-Wide Defaults (OWD):** The baseline security setting that determines the default level of access users have to records they do not own, forming the foundation of the sharing model.
- **Reports and Dashboards:**
 - **Reports:** Structured lists or summaries of data that help in analyzing business information.
 - **Dashboards:** Visual representations of key business metrics and trends, providing a quick, at-a-glance overview of performance.
- **Flows:** A powerful automation tool used to build, manage, and automate business processes. Flows can collect data, update records, and run tasks automatically based on defined triggers.

- **Apex Triggers:** Custom code that executes before or after a record is inserted, updated, or deleted. They are used to implement complex business logic that cannot be achieved with standard declarative tools.
- **1. Setting Up a Salesforce Developer Org:**
- • Sign up for a Developer Org with your details using <https://developer.salesforce.com/signup>
- • Verify your email, set a password, and access the setup page.

Activation through the salesforce developer mail.

2. Custom Objects Creation:

Procedure for Object Creation: Defines the method of setting up custom objects in Salesforce, including naming, data type selection, and enabling reporting and field tracking.

Four custom objects:

- Buyer__c: Stores customer details and manages their fuel purchases.
- Fuel_details__c: Records fuel transactions linking buyers, suppliers, and gas stations.
- Gas_Station__c: Maintains gas station information, fuel availability, and usage.
- Supplier__c: Tracks suppliers and the total fuel supplied to stations.

3. Custom Tabs:

Represents a way to access Salesforce objects easily.

- Tabs are created for each custom object - Buyer, Fuel Details, Gas Station, and Supplier allowing users to navigate and manage records efficiently within the Lightning App.

Custom Tabs

You can create new custom tabs to extend Salesforce functionality or to build new application functionality.

Custom Object tabs look and behave like the standard tabs provided with Salesforce. Web tabs allow you to embed external web applications and content within the Salesforce window. Visualforce tabs allow you to embed Visualforce pages. Lightning Component tabs allow you to add Lightning components to the navigation menu in Lightning Experience and the mobile app. Lightning Page tabs allow you to add Lightning Pages to Lightning Experience and the mobile app.

Action	Label	Tab Style	Description
Edit Del	Buyers	Blank	
Edit Del	Fuel details	Factory	
Edit Del	Gas Stations	Car	
Edit Del	Suppliers	Airplane	

Web Tabs

No Web Tabs have been defined

4. Create Lightning App:

Created Gas Station App for managing CRM operations. Configured with required custom objects for smooth usage.

- Created Lightning App “GAS STATION”.
- Assigned to System Administrator profile.
- Created objects:

1. Buyer
2. Fuel Details
3. Gas Station
4. Supplier

and added necessary fields to each for managing the Gas Station CRM.

5. Fields to be created:

- Buyer__c: First Name, Last Name, Customer Name (Formula), Phone Number, Email, Vehicle Type (Picklist), Fuel Filled in Vehicle, Mode of Payment (Picklist), Amount Paid (Formula)

- Fuel_details__c: Fuel Supplied (Number), Supplier Name (Master-Detail), Gas Station (Master-Detail)
- Gas_Station__c: Fuel Price per Liter (Number), Fuel Supplied to Bunk (Roll-up Summary), Fuel Used (Roll-up Summary), Fuel Available in Bunk (Formula)
- Supplier__c: Sum of Fuel Supplied (Roll-up Summary)

6. Create Page Layout for Objects:

Created page layouts for objects, organized sections, and arranged fields for better usability.

- Go to Setup → Object Manager → [Object] → Page Layouts → New.
- Create sections as needed and drag relevant fields into each section.
- Arrange fields for clear organization and improved usability.
- Click Save to apply the layout across the object.

7. Create Profiles:

Profiles ensure proper access control and define what data/actions each role can perform. They also help in maintaining security and restricting unnecessary access.

- Cloned an existing profile Standard User for manager and Salesforce Platform User for remaining.
- Give a Profile Name (Manager, Sales Executive, Sales Person) and click Save.

- Click Edit to configure Custom App Settings and Object Permissions for relevant objects.

- Adjust Session Settings and Password Policies as needed.

8. Creating Roles & Hierarchy:

- Go to Setup → Roles → Set Up Roles → Expand All and click Add Role under the relevant parent.
- Enter the Role Label (Manager); the Role Name auto-populates, then click Save.
- Create Sales Executive and Sales Person roles under the Manager with the assigned profiles.
- Ensure the hierarchy reflects reporting lines: Manager → Sales Executive → Sales Person.

Users are Salesforce accounts that allow access based on role and profile. In this project, users were created for Manager, Sales Executive, and Sales Person.

[illegible]

Permission sets extend users' access without changing their profiles. In this project, a permission set was created to give additional access to relevant objects.

11. OWD (Organization-Wide Defaults)

OWD settings define the baseline level of access users have to records they don't own.

- In this project, Gas Station and Supplier objects were set to Public Read-Only, while roles and profiles controlled additional access.

12. Create, View, Delete Records

User adoption measures how effectively users engage with Salesforce features.

- In this project, creating roles, profiles, permission sets, and intuitive layouts ensured smooth usage and higher adoption of the Gas Station CRM application.

The screenshot shows the 'New Fuel details' form in the Gas Station CRM application. The form is titled 'New Fuel details' and includes a search bar at the top. The form is divided into sections: 'Information' and 'Required Information'. The 'Information' section contains fields for 'Fuel details Name', 'Supplier Name' (with a dropdown menu showing 'indian oil'), 'Gas Station' (with a dropdown menu showing 'Gas-002'), and 'Fuel Supplied' (with a text input field containing '8,000'). The 'Required Information' section is currently empty. At the bottom of the form, there are three buttons: 'Cancel', 'Save & New', and 'Save'. The background of the application shows a sidebar with navigation links: 'GAS STATION', 'Suppliers', 'Gas Stations', 'Buyers', and 'Fuel details'. The 'Fuel details' link is selected. The main content area shows a 'Recently Viewed' section with 0 items and a message: 'Nothing to see here. There's nothing in your list yet. Try adding a new record.'

• View record.

The screenshot shows the 'View record' page for 'fuel-014' in the Gas Station CRM application. The page is titled 'fuel-014' and includes a search bar at the top. The page is divided into sections: 'Related' and 'Details'. The 'Details' section contains fields for 'Fuel details Name' (fuel-014), 'Supplier Name' (indian oil), 'Gas Station' (Gas-002), and 'Fuel Supplied' (8,000). At the bottom of the details section, there are two fields: 'Created By' (Vinodh Tadela, 9/23/2025, 8:47 AM) and 'Last Modified By' (Vinodh Tadela, 9/23/2025, 8:47 AM). The background of the application shows a sidebar with navigation links: 'GAS STATION', 'Suppliers', 'Gas Stations', 'Buyers', and 'Fuel details'. The 'Fuel details' link is selected. The main content area shows a 'Related' section with a 'Details' tab. The 'Details' tab is active, showing the record details. The 'Related' section is currently empty.

- **Delete record**

13. Creating Reports

Reports are used to analyse and display Salesforce data in a structured format.

- In this project, custom reports were created to track fuel usage, customer activity, and sales for better decision-making.

GAS STATION

Suppliers Gas Stations Buyers Fuel details Amount range X

Report: Gas Stations with Buyers Amount range

Total Records: 10 Total Amount Paid: 153,703.00

Fuel Available in bunk	Customer Name	Gas Station: Gas Station Name	Amount Paid
-160.00 (1)	rames potnuri (1)	Gas-019	16,000.00
	Subtotal		16,000.00
Subtotal			16,000.00
-156.00 (1)	raghu varan (1)	Gas-007	17,004.00

14. Creating Dashboards

Dashboards visually display key metrics and report data in charts and graphs.

- In this project, dashboards were created to provide insights on fuel estimation, sales, and customer activity.

15. Creating Flow

Helps in reducing manual effort and ensures quick communication with customers.

- A record-triggered flow was created on the Buyer object.
- The flow triggers when a record is created or updated.
- It automatically sends an email receipt to the customer.
- The email includes Customer Name, Amount Paid, Vehicle Type, and Fuel Intake.

16. Creating Apex Triggers

Apex triggers are custom code that execute before or after events on records.

Handler (FuelRecordHandler.apxc)

- beforeDeleteInfo → Stops deletion of Fuel Details if supplier qty > 500.
- beforeDeleteGas → Ensures Gas Station fuel price > 50 before insert.

```
1 public class FuelRecordHandler {
2
3     public static void beforeDeleteInfo(list<Fuel_details__c> fuellist){
4
5         //fuellist = [select Id from Fuel_details__c];
6
7         for(Fuel_details__c ful : fuellist){
8
9             if(ful.Fuel_supplied__c > 500){
10
11                 ful.addError('you cannot delete the fuel details record because it is associated with supplier and Gas station records');
12
13             }
14
15         }
16
17     }
18 }
```

Trigger: Fuel Details (before delete)

Prevents deleting Fuel Details if linked records exist.

```
1 trigger beforeDelete on Fuel_details__c (before Delete) {
2
3     if(trigger.isbefore && trigger.isDelete){
4
5         FuelRecordHandler.beforeDeleteInfo(trigger.old);
6
7     }
8
9 }
```

Trigger: Gas Station (before insert)

Validates fuel price before record creation.

```
1 trigger beforeInsert on Gas_Station__c (before insert ) {
2
3     if(trigger.isbefore && trigger.isinsert){
4
5         FuelRecordHandler.beforeDeleteGas(trigger.new);
6
7     }
8
9
10
11 }
```

Enhanced Features with Salesforce Einstein

By integrating Salesforce Einstein, the Gas Station App can leverage artificial intelligence to transform both the customer experience and operational efficiency. This suite of AI features provides powerful tools for personalized engagement, predictive insights, and automated work flows.

Key Einstein Features

- **Einstein Bots:** Deploy **AI-powered chatbots** to provide instant, 24/7 support. These bots can handle common customer inquiries, such as real-time fuel prices, promotions, and store hours. They can also automate tasks like sharing digital receipts and providing directions to the nearest station.
- **Einstein Next Best Action:** This feature enables **personalized, real-time recommendations**. Based on a customer's purchase history and behaviors—such as frequent fuel grade or snack purchases—the app can offer them a personalized discount on their preferred item or suggest a complementary product at the time of checkout.
- **Einstein Activity Capture:** Automate the logging of customer interactions. This includes automatically capturing and linking emails from customers to their profiles, ensuring a **complete and accurate record of communication**. This saves time for staff and provides a comprehensive view of the customer relationship.
- **Einstein Analytics Dashboards:** Visualize key business metrics through interactive dashboards. Gain insights into **sales trends, supplier performance, and inventory levels**. These dashboards can help managers make informed decisions by identifying peak hours, popular products, and opportunities to optimize operations.
- **Einstein Prediction Builder:** Utilize predictive AI to forecast customer behavior. By analyzing historical data, this feature can predict which customers are most likely to return, allowing for **highly targeted and effective marketing campaigns** to increase customer loyalty and retention.

Einstein Lead Scoring: (Additional Feature) For business customers or fleet managers, this feature can predict which leads are most likely to convert into paying accounts, helping the sales team prioritize their efforts and focus on the most promising opportunities.

Conclusion:

The Gas Station CRM project in Salesforce represents a comprehensive solution designed to streamline and automate the entire spectrum of core business operations. This robust application successfully transitioned the business away from manual, paper-based processes, leading to significant improvements in data accuracy and operational efficiency. The system's foundation is built upon a tailored custom data model, centralizing all essential business information through key objects. For instance, the Buyers object meticulously tracks customer details, including their complete purchase history and communication preferences, while the Suppliers object manages all aspects of fuel and product providers, from contract terms and pricing to delivery schedules. Furthermore, the Fuel Inventory object provides a real-time view of fuel levels across different grades, and a detailed Transactions object logs every sale with critical information like fuel type, quantity, and total price.

By utilizing Profiles and Permission Sets, the application grants access based on specific user roles. The Manager profile, for example, is equipped with comprehensive access to all data and high-level dashboards, allowing for strategic oversight and resource management. In contrast, the Sales Executive profile is permissioned to manage supplier relationships and analyze market trends, without the need for administrative access. The Sales Person profile, tailored for daily operations, is limited to creating and updating transaction and buyer records, ensuring they only view the information necessary for their tasks and protecting the confidentiality of other business data.

Automation was a cornerstone of the project, with Flows and Apex Triggers replacing repetitive manual tasks with dynamic, automated processes. A key automation is the flow that automatically generates and emails a digital receipt to the buyer upon completion of a transaction, providing immediate and professional service. A trigger on the Fuel Inventory object, for instance, prevents transactions that would result in negative stock, while another on the Transactions object validates the entered price against the standard price book to maintain pricing consistency. All of this data is leveraged through a suite of Reports and Dashboards that offer invaluable insights. Managers can view real-time performance indicators like a daily sales summary, fuel usage trends by grade, and a list of top-performing buyers. This initial implementation also lays a strong foundation for future growth, with the potential to integrate a customer loyalty program, mobile app access for staff, and real-time alerts to further enhance operational excellence and drive new business opportunities.
